## SOLITRON MIDI Multi-Function Analog Switching

### Type RJ1P

- AC semiconductor contactor
- Multi-function - 5 selectable modes of operation: Phase Angle, Distributed Full Cycle and Burst Control (1, 3 and 10s)
- Direct copper bonding (DCB) technology
- LED-indication for control and load status
- Operational ratings up to 50 AACrms and 600 VAC
- 4-20mA or 0-10V control input
- Built-in varistor
- Non-repetitive voltage: Up to 1200Vp
- Opto-isolation > 4000VACrms
- Cage clamp terminals
- IP20 protection

## Product Description

The Solitron Midi Analog Switching is a single-phase SSR that provides proportional output power in relation to the control signal level applied. This microprocessor-based device provides for 5 different switching modes integrated into one package. A selector switch on the front of the device is used for the selection of the preferred mode of operation, i.e., either Phase Angle, Distributed Full Cycle or Burst

Control. This multi-function selection makes this device ideal for the control of a variety of loads, including heaters and lamps. The control signal can be either 4 - 20mA or 0 - 10VDC. 4mA or 0V correspond to zero output power, whilst 20mA or 10VDC correspond to full output power. The product is ready to mount on DIN-rail or chassis and comes with integral heatsink.

## Transfer characteristics

Output power as a function of control input

Control Current (mA)	Control Voltage (VDC)	Output Power (%)
4	0	0
8	2.5	25
12	5	50
16	7.5	75
20	10	99

## Connection Examples

Note 1: For the RJ1P.V..., it is possible to have the ground terminals of the supply and control power supplies used commoned. In the case, this common ground is connected either to terminal A2 or terminal A3. This is only applicable when a 24 VDC supply voltage is used. There should be no external direct link from Terminal A2 to Terminal A3.

Note 2: It is recommended that mains voltage is present at Terminals L1 and T1 prior to application of control and/or supply input.

## Operation

**MODE 1:** The Phase Angle switching mode works in accordance with the phase angle control principle, i.e. the output switching point in the AC sine wave depends on the signal level applied at the input. The relay switches off everytime the output current crosses zero.

**MODE 2:** The Distributed mode provides a number of full cycles, evenly distributed over a fixed period of 1.28s @ 50Hz (1.07s @ 60Hz), depending on the control input.

**MODE 3, 4, 5:** The Burst Switching mode generates a number of full cycles, depending on the control input over fixed periods of 1s, 3s or 10s for MODES 3, 4 and 5 respectively.

**Modes 2, 3, 4 and 5** use the zero switching principle, thus ensuring a reduced level of radiated and wire-conducted noise. The Distributed and Burst Switching modes are not recommended for light control due to light-flickering.

### LED INDICATION

The top Red LED indicates the load status. It goes ON whenever the load is activated. The Green LED gives indication of the status of the control input.

Upon application of control current (for the RJ1P.I...) to terminals A1-A3, the Green LED will be dimly lit, with its intensity increasing with an increase in control current.

For the RJ1P.V..., the Green

LED will be ON (flickering) upon application of the supply voltage to terminals A2 - A4. Once a control voltage is applied to terminals A1 - A3, the Green LED will be fully ON, if greater than a threshold voltage (approx. 0.5V). Note that the first time the device (voltage control version) is to be activated, the mains voltage has to be present for the Green LED to indicate the control status.
